

MyLab and Mastering - Early Alerts

What if you could identify when students might be struggling early in your course?

With Early Alerts in select MyLab and Mastering courses, you can do exactly that.

Early Alerts uses an algorithm—developed from years of research—that analyzes data from student performance within MyLab and Mastering and projects risk levels to alert you when a student may be struggling.

With Early Alerts, you can filter information and view useful metrics that include correct answers on-first try, current risk status, weekly risk history, and scores.

The ability to analyze and compare students' quiz and homework scores provides deep insight into performance and reveals struggling students.

With these insights, you can then intervene and connect with those students as early as possible, providing feedback and support to help them stay on track.

That's how Early Alerts lets you provide support when students need it most, so they can successfully complete their course.
